Education	University of California, Berkeley , Berkeley, CA	Summer 2017 – May 2023
	<i>Doctor of Philosophy in Economics</i>	
	George Break and Helen Schnacke Break Endowed Fellowship in Economics	
	Outstanding Graduate Student Instructor Award (Top 10% of GSIs)	
	Massachusetts Institute of Technology , Cambridge, MA	Spring 2015 – Fall 2015
	<i>Advanced Study Program</i>	
	University of Michigan , Ann Arbor, MI	Fall 2011 – Spring 2014
	<i>Bachelor of Science in Honors Economics and Mathematics</i>	
	Graduated with the Highest Distinction	
	Central Michigan University , Mt. Pleasant, MI	Spring 2010 – Summer 2011
	Transferred to University of Michigan	

Areas Macro-Finance, International, Corporate Finance, Banking.

Published & Working Papers [Business Complexity and Risk Management: Evidence from Operational Risk Events in U.S. Bank Holding Companies](#) (with Anna Chernobai and Ali Ozdagli). *Journal of Monetary Economics*, 117 (2021): 418-440.

Abstract: Recent regulatory proposals tie a financial institution's systemic importance to its complexity. However, little is known about how complexity affects banks' risk management. Using the 1996–1999 deregulations of U.S. banks' nonbanking activities as a natural experiment, we show that banks' business complexity increases their operational risk. This result is driven by banks that had been constrained by regulations, compared with other banks and also with nonbank financial institutions that were never subject to these regulations. We provide evidence that managerial failure underlying these events offsets benefits of strategic risk taking.

[Multinationals and Uncertainty: The Role of Internal Capital Markets](#). 2025.

Abstract: Despite their importance, we know little about how the internal capital markets (ICMs) of multinational enterprises (MNEs) connect external lenders. My paper addresses this gap by studying the interaction between parent- and subsidiary-level external lenders. I first derive the optimal debt structure of MNEs, explaining the role of subsidiary-level external debt. When used to incentivize delegated monitoring, I show that MNEs can substitute it with cheaper parent-level external debt to offset deleveraging pressure from local shocks that enhance the monitoring incentives. Using Brexit uncertainty as a natural experiment, I provide evidence of this channel at both parent and subsidiary levels.

[Uncertainty, Stock Prices, and Debt Structure](#) (with Ali Ozdagli). 2025. Revision invited, *Management Science*.

Abstract: Despite the recognized importance of debt structure in transmitting economic shocks, we know little about its role in transmitting uncertainty. We find that bank debt reduces stock price sensitivity to policy uncertainty, unlike non-bank debt. This mitigating effect comes from cash-flow insolvent firms, consistent with the idea that they particularly value renegotiability of bank debt. We use high-frequency methods to address challenges in identifying policy uncertainty shocks, focusing on the 2018-2019 U.S.-China trade policy uncertainty and the monetary policy uncertainty around FOMC announcements. Our results suggest that bank debt provides insurance and flexibility for shareholders of distressed firms, especially during uncertain times.

[The Anti-Competitive Effect of Input Tariff Liberalization](#) (with Petr Martynov and Yipei Zhang). 2025.

Abstract: This paper studies the welfare implications of input tariff liberalization in a model featuring firm heterogeneity in both exposure and responses to input tariff shocks. We show that this setting gives rise to a new anti-competitive effect that dampens the benchmark welfare gains from trade liberalization. We derive a sufficient statistic for this anti-competitive effect in a general environment: the correlation between firm market shares and their cost shares of imported inputs. The interplay between import intensiveness and market power implies that larger firms benefit more from input tariff cuts while passing through less of the cost reductions, leading to increased aggregate markup dispersion. We empirically test this framework using granular regulatory data from Colombia around its 2010 trade reform. The data covers the universe of firm-level inputs, both imported and domestically sourced, allowing us to disentangle firm-specific exposure and responses to input tariff shocks. Our quantitative analysis demonstrates that input tariff liberalization induces a substantial anti-competitive effect, comparable in magnitude to the pro-competitive effects in the studied episode.

[Parent Company Debt and Subsidiary Bank's Risk-taking: Evidence from Large Bank Holding Companies](#) (with Kebin Ma, David Skeie, and Jing Ye). 2025.

Abstract: We investigate the influence of the parent company's capital structure of a bank holding company's (BHC) on the risk-taking behavior of its subsidiary banks, taking into account the BHC's organizational structure. Our analysis shows that increased parent debt is associated with reduced risk-taking by subsidiary banks. This effect is particularly prominent in BHCs with significant non-bank business, which would give the parent company greater incentives to constrain risk-taking in the subsidiary bank to prevent any spillover of loss. These findings highlight the need to consider the capital structures of the subsidiary, the parent, and the overall BHC—as well as the organizational structure—when assessing a subsidiary bank's risk profile.

[Anticipation Effects and Fiscal Multipliers: Evidence from WWII](#) (with Abhi Gupta). 2023.

Abstract: Correctly estimating fiscal multipliers depends on correctly recording when news of future spending breaks. The leading approach from Ramey (2011) deals with this issue by constructing fiscal shocks using news articles on defense spending. As an alternative, we construct a new measure of excess returns on military contractors over 1936-1947. Excess returns systematically lead the defense news series and produce more persistent dynamic responses of output and government spending. We estimate a long-run fiscal multiplier of 0.7. We consider two explanations for these discrepancies in the context of WWII: slow-moving changes in public expectations and private, pre-war coordination between defense-related firms and the government. For the first, we show that controlling for pre-war expectations of future spending renders both the news series and excess returns poor predictors of government spending. For the second, lagging (leading) the excess returns (defense news) series can approximately reproduce the impulse responses generated by the other, suggesting that firms' returns are measuring the same eventual spending as the defense news series but are responding earlier in time.

Work in Progress **Inventories and Monetary Policy Transmission** (with Marco Brianti and Vito Cormun). Formal draft forthcoming.

Cross-Border Monetary Policy Spillovers and Internal Capital Markets of Firms
(with Björn Imbierowicz and Xiaoyu Liu).
